#### 1. Aims of First Aid

The three main aims of 'First Aid' are to:

- Preserve life
- Prevent worsening & alleviate suffering
- Promote recovery

#### 2. Roles and Responsibilities

The role of the First Aider is to:

- Check for danger (for everyone)
- Identify the injury / illness
- Decide priority of care
- Preserve dignity
- Communicate with the casualty, colleagues, bystanders, emergency services, parents / next of kin
- Arrange transportation
- Take care of own PTSD if applicable
- Ensure the incident is reporting correctly

For a list of first aiders at school, see Appendix A. These are members of staff with up-todate first aid training and may be paid extra for the responsibility of administering first aid / medicine (depending on job role). The poster is displayed prominently throughout school. Staff working with under 5s most have an up-to-date paediatric first aid qualification. Any teacher can also administer <u>basic</u> first aid or administer medicine. In all cases, staff such seek a second opinion if unsure.

The school's admin assistant keeps a list of training / qualifications and organises new training when required (through <u>www.crystalclear1staidtraining.co.uk</u>). She also ensures the first-aid area is appropriately stocked.

This policy applies to pupils and adults in school (staff & visitors). For any babies who may be on-site, the procedures are different (see advice in paediatric first aid booklet).

#### 3. Organisation

The first-aid area in school is located in the KS2 corridor. This is stocked with all the equipment needed to administer basic first aid. In all cases, appropriate steps should be taken to minimise infection (e.g. wearing gloves / protective clothing; proper disposal of clinical waste).

#### 4. Medication

If children have a long-term medical condition that requires medication, a care plan must be drawn up with the parents. Specific training may need to be organised for individual members of staff (e.g. epilepsy medication).

For short-term medication (e.g. a course of antibiotics with 4 or more doses per day), parents must complete a Medication Form (Appendix B). All medicines should be clearly labelled with the child's name and handed in person to an appropriate member of staff. This also applies to over-the-counter medicines such as paracetamol. When administering the medicine, the form is signed by the first aider and checked by another member of staff.

They are locked away in the First Aid cupboard or fridge as appropriate (alongside the form). If they need to go home at the end of the day, they should be handed back to parents. If a child comes to school via SEND transport, medication should instead be handed to the escort (and signed for).

## 5. <u>Recording & reporting</u>

Where medication has been administered in school, this is clearly recorded on the medication form (including the time).

When a child needs first aid, this is recorded in the 'Accident Book' kept in the first aid area. This is for minor incidents such as cuts & bruises and details what action was taken, when and by whom. In most cases, this is the only recording required.

If a child has bumped their head, parents are contacted to inform them of what happened and given advice on how to monitor them (see Appendix C: Bump note). Parents are also contacted for other incidents if necessary / serious enough. It may sometimes be necessary to contact parents to collect children early (or at least come up to school and give medicine if none is already in school). For serious incidents (or any incident involving an adult), a more detailed Accident Form is also completed (Appendix D). Page 1 is completed by the first aider; page 2 is completed by the headteacher. This form is then shared with the CEO of Peak Edge (who may suggest a course of action to prevent further incidents). In extreme cases, incidents need to be reported to RIDDOR (<u>www.riddor.gov.uk</u>) or Ofsted.

These records are kept in accordance with the Data Protection Act 2018.

## 6. Emergency Procedures

#### a) Primary Survey

When arriving on the scene, the first aider must conduct a 'Primary Survey' in order to decide on the best course of action. A useful acronym to assist here is DR CABC (see below). If there is more than one casualty, decide who is in most need (usually the quietest one!)

D	Danger	Survey the scene and remove any obstacles if possible (e.g. fallen chairs). Clear the area of	
		bystanders and preserve the patient's dignity	
		Check the patient's consciousness by saying	
R	Response	their name. If unresponsive, they should shout	6c
		then shake them gently by the shoulders	
C	Catastrophic Blooding	Check for any catastrophic bleeding. If any is	64
C	Catastrophic bleeding	discovered, this must be treated first	bu
		Treat any life-threatening airway problems. If the	
А	Airways	patient is unconscious, tilt their head back to	7g
		open the airway.	
		Check to see if the patient is breathing normally*.	
В	Breathing	If so, put them in the recovery position. If not,	6e
		move on to C – Circulation / CPR.	
С	Circulation / CPR	Perform CPR.	6f

\*Defined as 2-3 breaths per 10 seconds for an adult and 4 for a child (5-7 for a baby). If breathing is agonal (infrequent, noisy, gaspy), this is a sign of deterioration and CPR should be administered.

#### b) Consent

Before performing first aid on someone, consent must be obtained. For pupils, this is given by parents upon registration at the school. If an adult refuses first aid, they should sign the accident form to confirm this. First aid can be given to an adult without consent if they become unconscious (including where they have previously denied consent as the situation has changed). If someone has a 'DNR' (Do Not Resuscitate), a copy of the certificate should be kept in school.

#### c) Information gathering

It is important to gather as much information as possible; a useful acronym to assist here is SAMPLE:

- S Signs & Symptoms (what can you see? How does the patient feel?)
- A Allergies (do they have any?)
- M Medication (are they taking any?)
- P Past medical history
- L Last meal (what was it? When? When did they last go to the toilet?)
- E Event history (what happened?)

In the event an ambulance is needed, the emergency services will ask for this information.

#### d) Bleeding

'Catastrophic bleeding' has moved above ABC in the primary survey because it is possible for a patient to bleed to death in 1-3 minutes. The table below shows the consequences of blood loss:

Percentage	Quantity*	Consequences
10%	1 pint	Normal – no significant consequences
20%	2 pints	Dizziness, may become pale, pulse / breathing increases
30%	3 pints	Cold, clammy skin; turn blue around extremities; pulse goes
		above 100; may become unconscious
40%	4 pints	Turning blue, unconscious, go into shock – death is
		imminent.

\*This varies from person to person. These figures are for approximation only and apply to an adult weighing 180lb. For this reason, bleeding is treated first (see section 7b for advice about treating wounds). If the patient has lost a lot of blood but still conscious, they should lay on the back with legs in the air. The first aider should aim to maintain body temperature and loosen any tight clothing. Lips can be moistened but they should not drink. A tourniquet should NOT be applied unless the first aider has had specific training for this.

#### e) Recovery position

If the casualty is unconscious but breathing normally; they should be placed in the recovery position (pictured). The head should be tilted and facing downwards to allow fluids to drain from their mouth. They should be made as comfortable as possible by removing

glasses, watches or any items in pockets. If they are cold, they could be covered with a blanket. If they need to be in the recovery position for a long time, turn them over onto their other side every 30 minutes (if possible). Anyone who may be pregnant should always be on their left side.

## f) <u>CPR (including use of defibrillator)</u>

If CPR is required, the first aider must compress the sternum as shown in the picture (fingers interlocked, shoulders above): 30 compressions to 2 breaths. For a child (defined here as having not started puberty), start with 5 rescue breaths first. Do not stop until the ambulance arrives (it is recommended to change person every 2 minutes if possible). There is a defibrillator within school (with different pads for adults and children). This should be sent for and used ASAP.

It guides the user through the process and massively increases the chance of success.

#### g) Transportation; including calling an ambulance

The first aider must make the decision whether or not to call for an ambulance. If the decision is made, another member of staff should go and get the phone; dial 999 and put it on speaker phone. If an ambulance is not required but the person does need the hospital, we would first telephone the parents / next of kin and decide together how to get them

there. If there are no alternative forms of transport, they can go in a fully insured staff car (the first aider should go in addition to the driver).

#### h) Accidental injury during first aid

The main goal of first aid is to preserve life. Occasionally, this may cause other (non lifethreatening problems); for example a broken rib when carrying out CPR or bruising when dealing with choking (see section 7f). This is undesirable of course but may be unavoidable. If this does occur, we will record it clearly on the accident form and communicate it to parents / next of kin.

#### 7. Specific Instructions:

## a) Temperature

When children feel unwell, one of the first things we do is take their temperature. A 'normal' temperature is 37°C but this can vary from person to person. If their temperature is between 38-40°C, they could have a fever or be dehydrated. We advise them to drink water and take steps to cool them down (removing jumpers, using a cold compress and / or an electric fan). If above 39°C, we contact parents and consider ringing an ambulance (depending on other symptoms) if it is close to 40 °C. When they are too cold, we try to warm them up and contact parents if they are 35°C or below.

## b) Cuts, bruises and wounds

Simple cuts and grazes can be dealt with by whoever is first on the scene using the 'clean & cover' method. Clean with water or a wipe then cover with a plaster (unless the child is allergic to plasters). For new injuries that could turn into bruises, we apply a cold compress for up to 10 minutes. For major cuts / bleeds, we'd squeeze and elevate the wound and bandage appropriately. Ideally the patient should lay down with their legs raised.

## c) Nose bleeds

For nose bleeds, the patient should lean forward (not back) and pinch the soft part of their nose for 10 minutes. A cold compress on the back of the neck can help here. If this doesn't stop the bleed, it can be repeated up to a maximum of 30 minutes. At that point, we would seek medical advice as it could be a symptom of something more serious.

#### d) <u>Sick</u>

If a child is sick in school, this should be disposed of appropriately and the area should be cleaned with the correct chemicals. The patient should be sent home and not return for a further 48 hours.

#### e) Asthma

If a child with asthma has a blue (emergency) inhaler, we treat these the same as other medication (clearly labelled, stored securely). They should be easily accessible in an emergency but also made available for trips, routine PE lessons and swimming for example. Children needing to use a brown (non-emergency) inhaler, they can use this in school but they should be able to self-administer. Ideally, we'd ask parents to keep inhalers in school and get another one for home use.

#### f) Seizures

A seizure is caused by excess electrical activity in the brain. There are 54 different types altogether but the main ones are:

- a) Absence (the child may be staring)
- b) Focal (staring but with some repetitive movement)

c) Generalised (drop to the floor; jerking movements and noisy breathing) It is not 'epilepsy' unless this has been previously diagnosed. Absence and Focal seizures are not emergencies but should be checked out with a GP when convenient. Generalised seizures can be very serious and should be monitored carefully (following the patient's care plan if one exists). The first aider should NOT restrain the patient; instead remove dangers, make them comfortable and time it! Afterwards, they may be unresponsive for up to 20 minutes. If they are not breathing, CPR should be administered as detailed above. The patient should go to hospital if it is their first such seizure, it lasted for more than 5 minutes or they had a 2<sup>nd</sup> one after coming round.

#### g) Choking

If someone is choking, it can be a partial / mild choke (they can cough) or complete / severe (they can't cough). If they can cough, lean them forwards and ask them to cough (harder). If this doesn't work, they may need up to 5 'back blows' or a thrust (go behind them, pull in and upwards just above the belly button). Hospital is only required if thrusting was necessary (may be internal bleeding), there was blood in the saliva or they still think the object may be stuck. If they become unconscious, follow the procedures for CPR.

#### h) Burns / scalds

There are 3 types of burn:

- Superficial (1<sup>st</sup> degree), e.g. sunburn
- Partial (2<sup>nd</sup> degree), e.g. blistering from a hot pan
- Full thickness (3rd degree), e.g. electrical, chemical, acid, fire

A patient may have a mixture of 2 or more types and the damage may be worse than they think (they may be unable to feel the full extent if the nerves are burned). The correct procedure is to remove loose clothes (and jewellery), run under cold water for 20 minutes and cover loosely with cling film. We do not apply creams etc. or remove clothes that may be stuck to the body. Burns are measured as a percentage of the whole body. Generally, 1% = the size of the patient's pal (adult or child). Hospitalisation is required if:

- 5% or more of the body is covered in superficial burns
- 1% or more of the body is covered in partial burns
- There is any full thickness burning
- There is any burning to the face, hands, feet, joints, chest or genitals (as this could affect other key functions of the body).

#### i) Embedded objects (including splinters)

Splinters can be removed if they are not fully embedded. The procedure is to wash the affected area, remove it using tweezers, squeeze the area until it bleeds (to minimise the risk of infection), clean and cover the site with a plaster. Afterwards, check when the patient last had a tetanus jab and recommend a new one if it was a long time ago.

## j) <u>Sepsis</u>

5 people are killed by Sepsis every hour in the UK. It is caused by an infection getting into the bloodstream. It is therefore vital to ensure cuts are cleaned properly and any bandages etc. are clean before use (if dropped onto the floor, they should be discarded and replaced with a fresh one). Sepsis often presents as flu-like symptoms but can also be confused with meningitis. Symptoms start a few days after infection and can include:

- S Slurred speech / confusion
- E Extreme shivering / muscle pain
- P Passing no urine (in a day)
- S Severe breathlessness
- I It feels like you're going to die!
- S Skin mottled / discoloured (can look like corned beef
